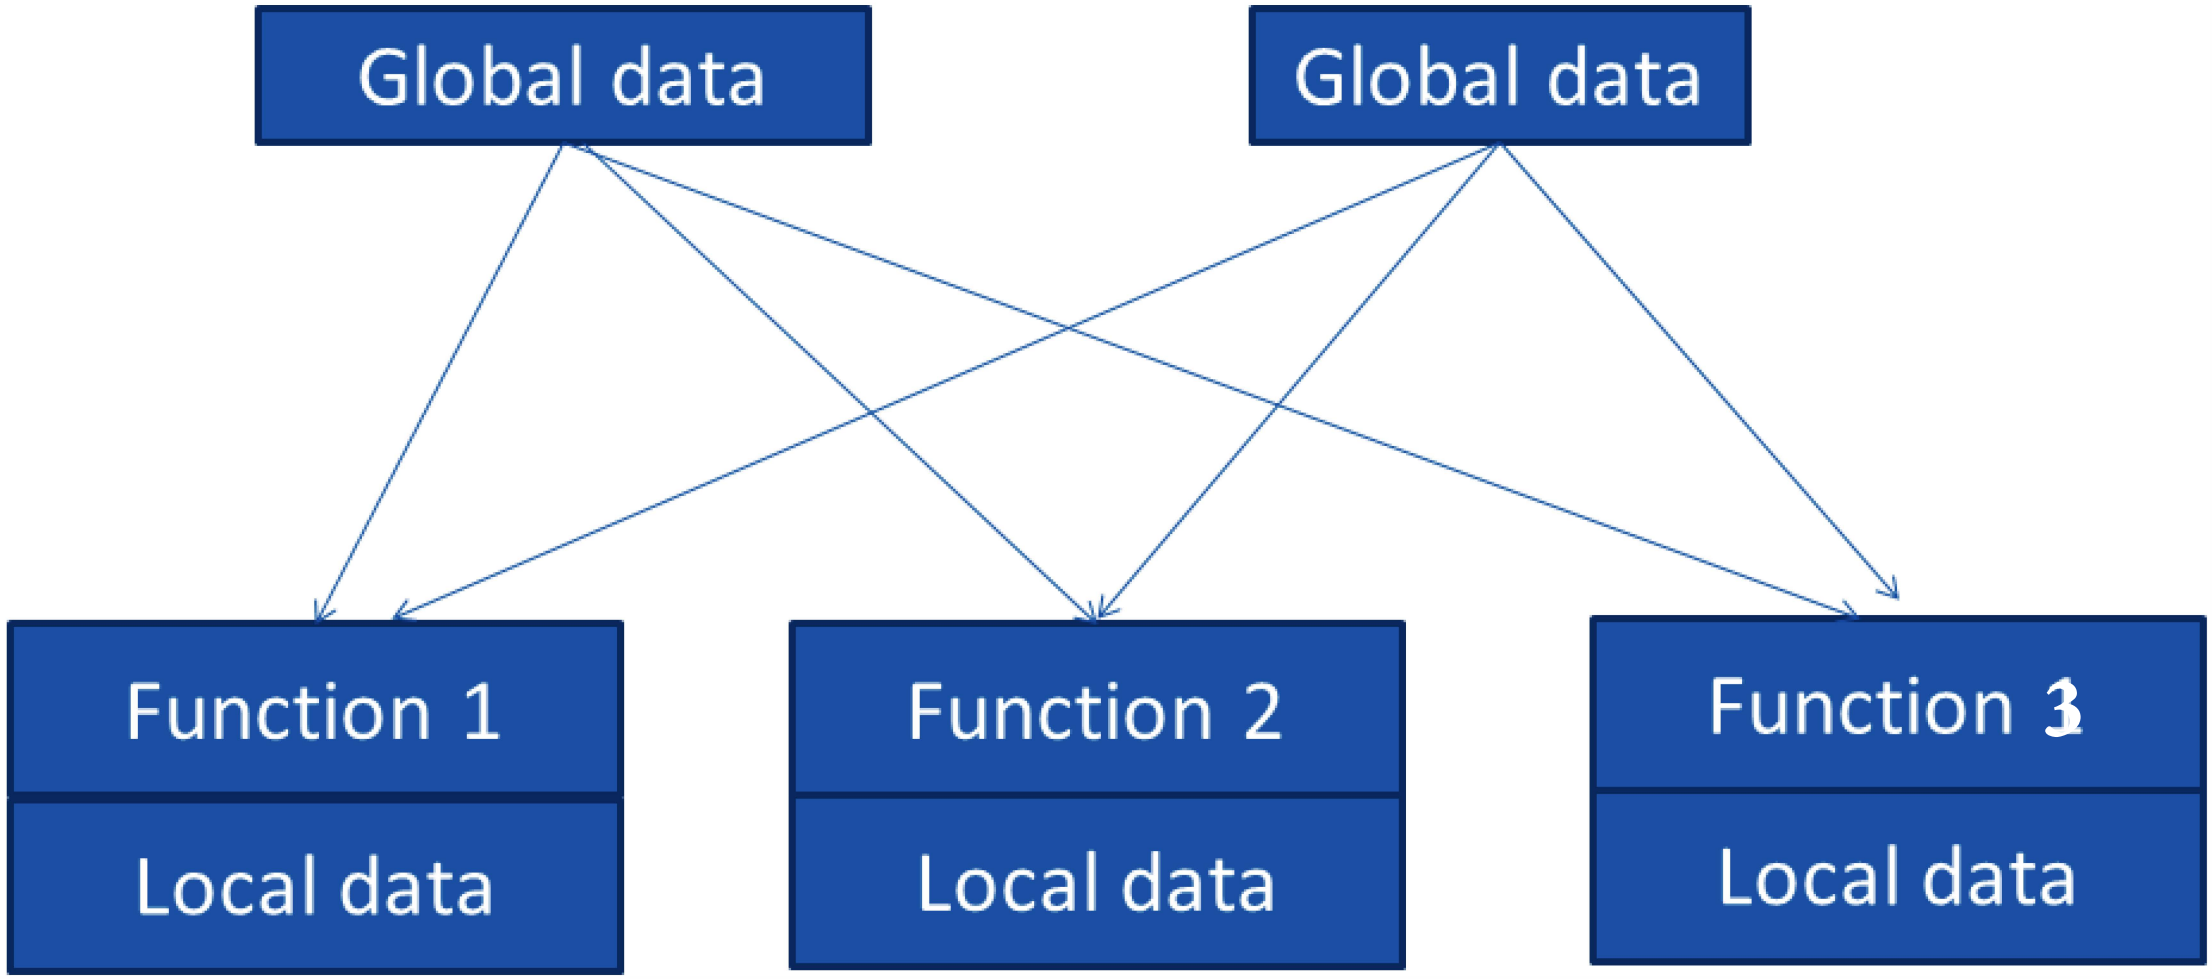
POP VS OOP

By

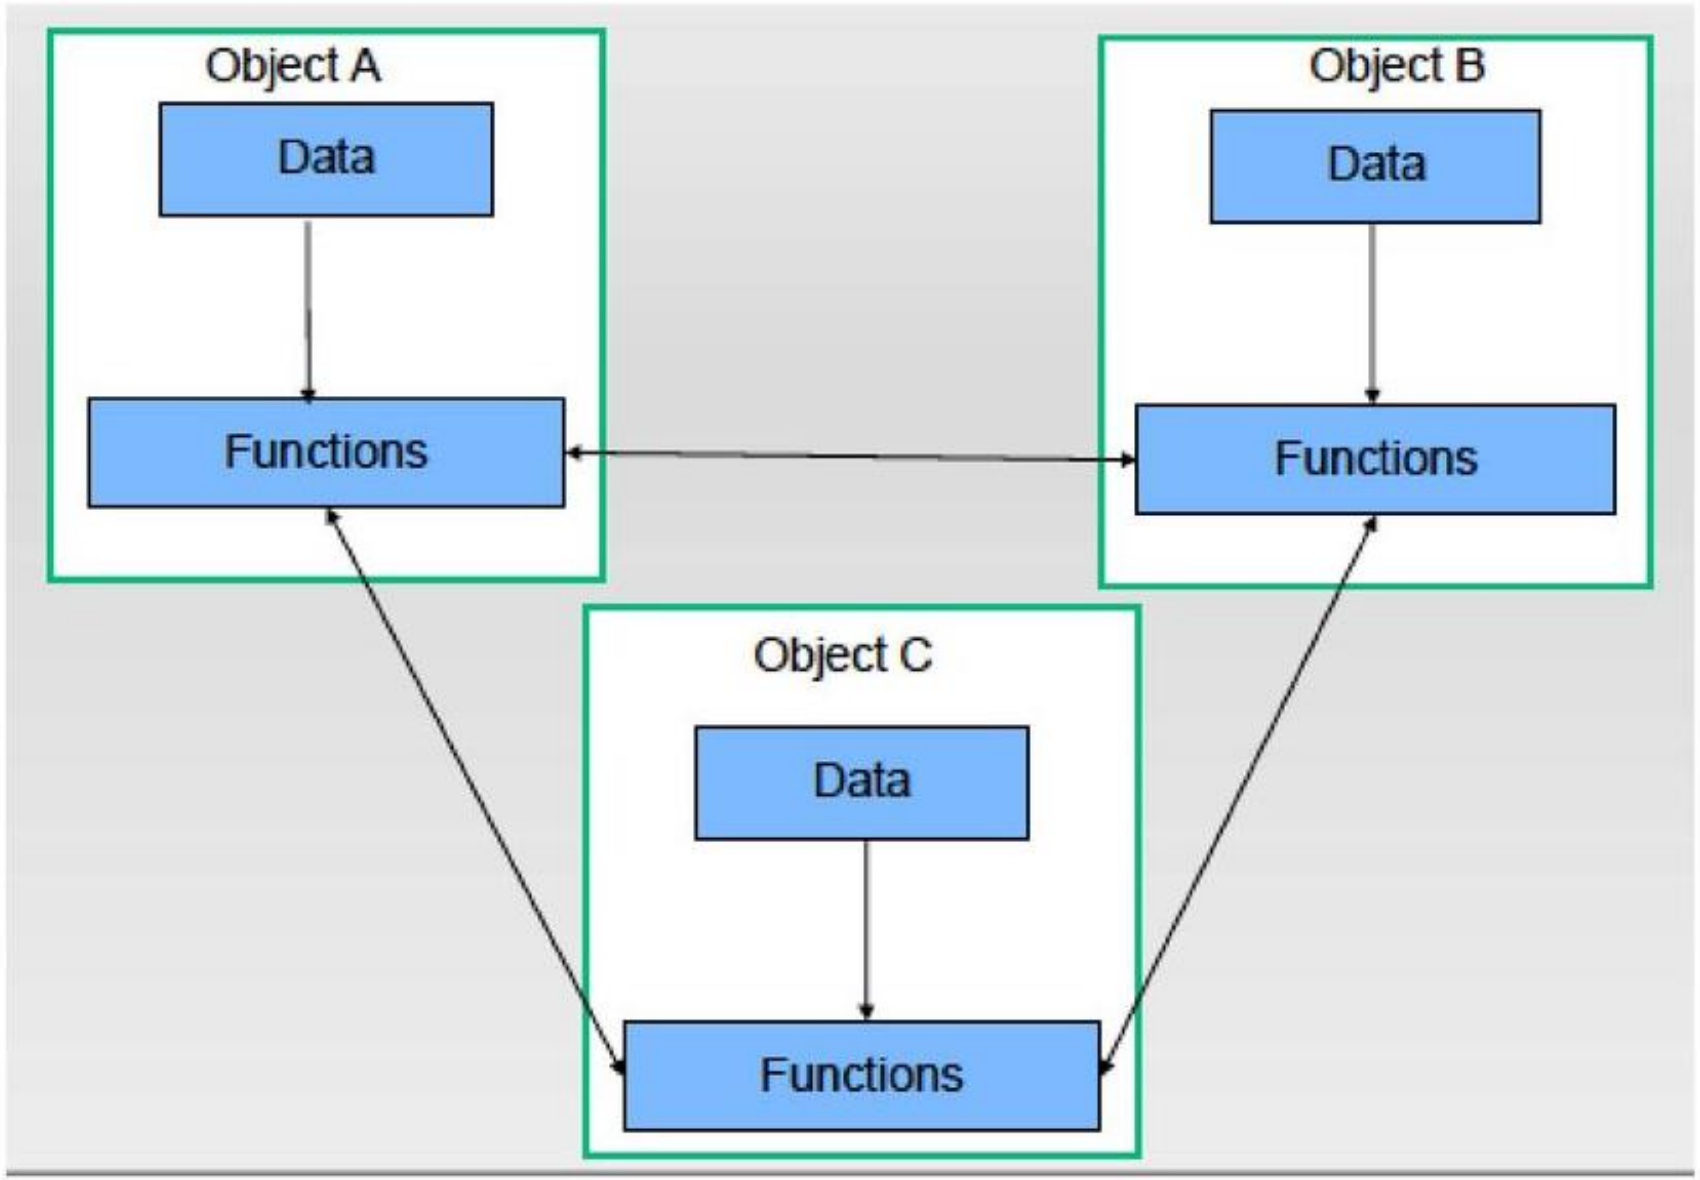
Dr. Piyush Bagla



Global data
Global data
Function 1
Local data
Function 2
Local data
Function 3
Local data

<u>Some characteristics of Procedure Oriented Programming are</u> :-

1) Emphasis is on doing things(algorithms).
2) Large programs are divided into smaller programs known as functions.
3) Most of the functions share global data.
4) Data move openly around the system from function to function.
5) Functions transform data from one form to another.
6) It is very difficult to identify which function has changed the data.
7) Data is less secure in this programming design.
8) It is difficult to add new data and functions whenever necessary.
9) POP doesn’t model real world problems.
10) Employs top-down approach in program design.



Object A
Data
Functions
Object B
Data
Functions
Object C
Data
Functions

<u>Some characteristics of Object Oriented Programming are</u> :-

1) Emphasis is on data rather than procedures or algorithms.
2) Programs are divided into what are known as objects.
3) Data structures are designed such that they characterize the objects.
4) Functions that operate on the data are tied together in the data structure.
5) Data is hidden and cannot be accessed by external functions.
6) Objects may communicate with each other through functions.
7) Data is more secure in this programming design.
8) New data and functions can be easily added whenever necessary.
9) OOP model real world problems.
10) Follows bottom-up approach in program design.
